Menu Item: Baked Goods (Blue), Dairy Products (Orange), Fruits (Green), Meat (Purple), Vegetables (Pink)

Total Waste by Geographical Location

KPIs:

- The total amount of food prepared was 733k
- The total amount of food sold was 682k.
- The total amount of food wasted was 51k.
- The percentage of food wasted was 7%, which is high compared to the industry standard of 4-10%. The industry standard is usually between 4% to 10% of the purchased inventory. It is recommended to aim for a waste percentage 4% or below to optimize profitability and reduce environmental impact. Regular audits can help track progress and identify areas for improvement in food waste management.
- The restaurant has an efficiency of 93% which is average according to industry standards. Adjustments can be made to improve efficiency.
- The restaurant has a high sell through percentage of 93%, meaning conversion of goods received from suppliers to what was retailed to consumers was high.

Further Insights

- The highest contributing category to waste is sit down dinner, then finger foods and the least was buffet services.
- There is only little difference in the waste due to seasonality. Although the percentages were high for each season.
- Each menu item has the same waste percentage and therefore contribute the same amount of waste at the restaurant.
- Corporate events produce highest amount of waste, then social gatherings, weddings and then birthdays contribute the least amount of waste.

Drivers of waste at the restaurant

- **High pricing** was a huge driver of waste generated in the restaurant. The high priced foods, showed that costly meals discouraged people from purchase of those meals.
- Foods **stored** at room temperature caused far greater than foods that were refrigerated. It could be not refrigerating food at the restaurant caused great **spoilage** of food that led to waste.
- Regularly bought meals generated more waste than occasionally bought meals. This could be because the restaurant focuses on producing regularly bought, than occasionally bought meals. It doesn't necessarily indicate that because a meal is bought regularly is the primary factor why the meals get spoilt.
- Suburban **areas** produce higher waste, then the urban and then rural areas. This could be an indication that the quality of food produces by the restaurant satisfies the palette of those in rural areas.
- There is also **over production** of food as calculated from the amount of food produced and the amount food sold.

Recommendations

Improvements that can be made to alleviate waste in the restaurant are;

- Price balancing can be done. The prices can be reduced but not too low to compete with other restaurant. The restaurant could also focus on lower priced meals in larger quantities.
- The restaurant should invest more refrigeration tools and equipment, or other cooling systems.
- The restaurant can either improve the quality and standard of food to cater to those in suburban and urban areas, to satisfy their palette, or they can focus on customers in rural areas.
- The restaurant can also reduce over production of food, by calculating estimated amounts of customers received daily, and only produce the amount needed to satisfy the approximated number of customers for the day.
